**Additional Mineralisation Exposed In Road Cut
Potential Expansion of Kun-Manie - Ikenskoe Deposit**

Amur Minerals Corporation (AMC.AIM), an exploration and development company focused on Far East Russia announces nickel sulphide mineralisation has been exposed in a road cut located immediately to the south of the Ikenskoe deposit, which is the largest of the three drilled deposits within the Kun Manie exploration licence.

The nickel and copper mineralisation is expected to continue to the east and south of the drilled area of the deposit. During construction of the access road, the projected mineralised zone was exposed and visual inspection indicates the newly exposed outcrop contains abundant sulphides. Samples from the road cut were delivered to Khabarovsk for transshipping to the laboratory when the crew change occurred, on the weekend of June 12. Results will be announced once the ore has been tested and the results have been verified by a western certified laboratory.

Robin Young, CEO commented:

"This find confirms our belief that Ikenskoe could be substantially larger than presently reported, and our initial expectations are that the mineralisation extends both to the east and south of the known deposits.. I look forward to announcing the laboratory results when available."
